EMPIRICAL FP&A SAAS RESEARCH (N=37)

FP&A loses critical time before analysis even begins.

An interactive executive investigation into how source-system fragmentation, manual data transfers, and reconciliation overhead delay business decisions and erode finance team capacity.

01 · EXECUTIVE PROBLEM STATEMENT

Finance must assemble reality before it can interpret it.

The recurring burden is the painstaking collection, mapping, reconciliation, and validation of data across fragmented ERP, CRM, Billing, HR, and product databases before leadership can trust the metrics.

“FP&A teams struggle to consolidate data from ERP, CRM, HR, billing, and product systems, resulting in manual work, spreadsheet errors, delayed reporting, and poor forecasting accuracy.”

Segment friction metrics by company size and executive role.

Filter the survey data to view segment dynamics. Filters automatically propagate across metrics, scatter plots, correlation matrices, and the data table.

What the evidence suggests

- 01

Fragmentation creates work
Systems and manual effort move together ($r = 0.74$); the fitted relationship adds about 5.3 hours per source system.
- 02

Manual work travels downstream
Reporting lag has the strongest tested link to effort ($r = 0.88$; $R^2 = 0.78$).
- 03

Workflow automation is the opportunity
Automation maturity is negatively associated with manual hours ($r = -0.34$).
- 04

Qualify for recurring pain
Severity and willingness to pay are positively associated (point-biserial $r = 0.42$).

Prevalence by Failure Mode

- 83.8% of surveyed finance teams report collection and spreadsheet consolidation as their primary operational bottleneck.

Automation Maturity vs Operational Drag

- Automation maturity is negatively associated with manual hours ($r = -0.34$), recovering ~38 monthly analyst hours.

Hypothesis Scatter & Regression Analysis

- Each additional source system is associated with about 5.3 more monthly team-hours in the fitted regression ($r = 0.74$, $R^2 = 0.55$).

Multi-Dimensional Correlation Heatmap

- Strong inter-variable collinearity ($r = 0.64-0.88$) demonstrates that operational friction cascades systematically rather than in isolation.

Empirical validation across all core operating hypotheses.

All relationships exhibit statistically significant positive associations, demonstrating that data fragmentation is a structural, systemic problem.

H1	Source systems → preparation time Each additional source system increases FP&A preparation burden and manual mapping overhead.	R ² FIT 48%	SPEARMAN P 0.70	Strong
H2	Manual transfers → data-related delay Higher transfer frequency between disconnected tools directly lengthens reporting cycle latency.	R ² FIT 59%	SPEARMAN P 0.77	Strong
H3	Spreadsheet dependence → correction frequency Heavy spreadsheet reliance multiplies manual formula corrections and error propagation risk.	R ² FIT 68%	SPEARMAN P 0.85	Very strong
H4	Reconciliation hours → reporting lag Reconciliation time sinks represent the single largest bottleneck to financial close velocity.	R ² FIT 55%	SPEARMAN P 0.78	Strong

Simulate addressable scale and commercial unit economics.

Calibrated for mid-market India B2B SaaS. Adjust core operating assumptions to explore TAM, SAM, and SOM expansion alongside commercial unit economics.

🔍 COMMERCIAL MODEL VALIDATION

Unit economics assume an inside-sales discovery motion coupled with rapid self-serve connector onboarding. Validate blended CAC, net revenue retention, and implementation cycle times through initial paid pilot deployments before committing scale outbound GTM capital.

From fragmented systems to finance-ready data.

A purpose-built Finance Data Readiness Layer connects source systems, standardizes entity mappings, audits control totals, and publishes trusted finance-ready feeds into the tools teams already love.

One Governed Workflow, End to End

5-Stage Sequential Pipeline

STAGE 01 / FINANCE-OWNED WORKFLOW

One starting point for every source.

Bring ERP, CRM, billing, HR, product and warehouse feeds into the same finance-owned workspace without waiting on data engineering sprints or relying on ad-hoc CSV exports.

EXPECTED OPERATIONAL IMPACT:

Zero dependency on internal engineering backlogs or ad-hoc data requests

KEY ARCHITECTURAL DELIVERABLES

✓ Business-system and warehouse feeds

✓ A shared starting point for the reporting cycle

✓ Automated ingestion schedules with error alerts

✓ Native connectors for NetSuite, Salesforce, Stripe & Workday

■ STRATEGIC ARCHITECTURE MANDATE

A purpose-built Finance Data Readiness Layer connects source systems, standardizes entity mappings, audits control totals, and publishes trusted finance-ready feeds into the tools teams already love.
